PATHOLOGY REPORT

Clinical Information.	Pangastritis.
Nature of specimen.	Endoscopic biopsy.

GROSS:

Soft tissue fragments collectively measured 0.6 cm, totally embedded.

MICROSCOPIC:

Gastric mucosa showing mild atrophy and mild infiltration by lymphocytes and plasma cells. Lymphocytes aggregate in some foci to form lymphoid follicles with active germinal centers. Neutrophils are seen infiltrating glands thus indicating activity. H. pylori characteristic forms are present. There is no evidence of intestinal metaplasia, atypia or malignancy.

DIAGNOSIS:

Stomach, endoscopic biopsy:

- H. pylori associated mild chronic follicular gastritis with mild inflammatory activity.
- Negative for dysplasia or malignancy
