## PATHOLOGY REPORT

Clinical Information.	Oropharyngeal ulceration
Nature of specimen.	Oral biopsies

### GROSS:

Two biopsies were received:

The first from oral mucosa up to anterior fold of tonsil measuring 0.7x0.5x0.3 cm. The second from Lt cheek measured 0.4x0.3x0.2

### MICROSCOPIC:

Both biopsies show fragments of oral mucosa covered by focally ulcerated stratified squamous epithelium exhibiting focal psoriasiform hyperplasia with elongated rete ridges. The underlying lamina propria is replaced by a moderate to dense, diffuse inflammatory infiltrate, composed of monotonous population consisting predominantly of sheets of mature plasma cells. Scattered dilated capillaries (vascular ectasia) are noted within the inflammatory infiltrate. There is no evidence of granulomas, viral inclusions, or malignancy.

### DIAGNOSIS:

#### Oral Mucosa, Biopsies:

- Plasma Cell Mucositis with active inflammatory ulceration.
- Negative for malignancy.
