PATHOLOGY REPORT

Clinical Information.	Gastric mural defect.
Nature of specimen.	Endoscopic biopsy.

GROSS:

Soft tissue fragments collectively measured 0.9x0.7x0.4 cm, totally embedded.

MICROSCOPIC:

Sections of gastric wall show disrupted fibro-adipose and smooth muscle tissue with extensive acute and chronic inflammation extending into the perigastric fat. There is prominent fat necrosis, accompanied by hemorrhage, fibrin deposition, and granulation tissue formation consistent with an organizing serositis. No malignancy is identified.

DIAGNOSIS:

Gastric wall, biopsy:

- Active inflammatory ulceration with perforation.
- Organizing peritonitis with fat necrosis.
- Negative for malignancy.
