PATHOLOGY REPORT

Clinical Information.	Rt. modified radical mastectomy status post lumpectomy for breast cancer.
Nature of specimen.	Modified radical mastectomy

GROSS:

Fibrofatty tissue measured 15x9 cm, covered by a skin ellipse of 12.5x3.5 cm, with unremarkable nipple and areola, with attached axillary tail. Serial sectioning revealed obliterated tumor bed 1.8x1.5x1 cm. Surgical clearances are 6.2 cm, 1.2 cm, 3 cm, 10 cm and 1 cm from the superior, inferior, medial, lateral and deep margins, respectively. Dissected axillary lymph nodes are variable sized largest is 1 cm.

MICROSCOPIC:

- Procedure: Right modified radical mastectomy (post-lumpectomy).
- Residual tumor in breast: No residual invasive carcinoma identified.
- Tumor bed / prior lumpectomy site: Identified; shows post-surgical-related changes only.
- Residual tumor size: Not applicable (pT0).
- Extension to skin: None; nipple and areola free of tumor and Paget disease.
- Chest wall (pectoral muscle) involvement: Not identified.
- Margin status: All mastectomy margins free of tumor.
- Lymphovascular invasion: identified in the axillary tail.
- Perineural invasion: Not identified.
- Multifocality / multicentricity: Not applicable (no residual tumor).
- DCIS: Not identified in the mastectomy specimen.
- Number of lymph nodes examined: 14.
- Number positive for metastasis: 2 lymph nodes.
- Greatest dimension of metastatic deposit: 8 mm.
- Extra-nodal / extracapsular extension: Present (focal).
- Pathologic stage (AJCC, post-treatment): pT0N1Mx.

DIAGNOSIS:

Right breast, modified radical mastectomy (post-lumpectomy):

- Negative for residual invasive carcinoma or DCIS in the breast.
- Axillary lymph nodes: Metastatic invasive duct carcinoma, present in 2 of 14 lymph nodes, with focal extranodal extension.
- Pathologic stage: pT0N1Mx.
